

## Tutorial: Teaching Week 3

### Topics:

- Abstract Classes & Polymorphism
- References to Objects & Understanding the Stack
- Garbage collection
- Interfaces
- Overloaded Constructors & constructor chaining
- **static** & **final**: methods and variables
- **null** references / Strings
- GUI

### Sources of some questions:

- ✓ “Introductory Java Programming” book
- ✓ “Head First Java” book
- ✓ Java tutorial from <http://docs.oracle.com>

# Abstract Classes (1/3)

```
abstract class Card {  
    String recipient;  
    public abstract void greeting();  
}
```

Card.java

---

```
public class BirthdayCard extends Card {  
    int age;  
    public BirthdayCard(String r, int years) {  
        recipient = r;  
        age = years;  
    }  
    public void greeting() {  
        System.out.println("Dear " + recipient + ",\n");  
        System.out.println("Happy " + age + "th Birthday!\n\n");  
    }  
}
```

BirthdayCard.java

# Abstract Classes (2/3)

```
public class HolidayCard extends Card {  
    public HolidayCard(String r) { recipient = r; }  
    public void greeting() {  
        System.out.println("Dear " + recipient + ",\n");  
        System.out.println("Season's Greetings!\n\n");  
    }  
}
```

HolidayCard.java

---

```
public class ValentineCard extends Card {  
    int kisses;  
    public ValentineCard(String r, int k) {  
        recipient = r;  
        kisses = k;  
    }  
    public void greeting() {  
        System.out.println("Dear " + recipient + ",\n");  
        System.out.println("Love and Kisses,\n");  
        for (int j=0; j < kisses; j++) System.out.print("X");  
        System.out.println("\n\n");  
    }  
}
```

ValentineCard.java

# Abstract Classes (3/3)

```
public class CardTester1 {  
    public static void main(String[] args) {  
        String me = args[0];  
  
        HolidayCard hol = new HolidayCard(me);  
        hol.greeting();  
  
        BirthdayCard bd = new BirthdayCard(me, 18);  
        bd.greeting();  
  
        ValentineCard val = new ValentineCard(me, 3);  
        val.greeting();  
    }  
}
```

CardTester1.java

What is the output?

# Polymorphism

```
public class CardTester2 {  
    public static void main(String[] args) {  
        // Invokes a HolidayCard greeting().  
        Card card = new HolidayCard("Amy");  
        card.greeting();  
  
        // Invokes a ValentineCard greeting().  
        card = new ValentineCard("Bob", 3);  
        card.greeting();  
  
        // Invokes a BirthdayCard greeting().  
        card = new BirthdayCard("Cindy", 17);  
        card.greeting();  
    }  
}
```

CardTester2.java

What is the output?

# References to Objects

```
public class CardTester3 {  
    public static void main(String[] args) {  
        Card c;  
        ValentineCard v;  
        BirthdayCard b;  
        HolidayCard h;  
  
        c = new ValentineCard("Debby", 8);  
        b = new ValentineCard("Elroy", 3);  
        v = new ValentineCard("Fiona", 3);  
        h = new BirthdayCard("Greg", 35);  
    }  
}
```

CardTester3.java

Which statements are OK?

# Interfaces (1/3)

- Consider an interface named **Colorable**, as follows:

```
public interface Colorable { public void howToColor(); }
```

- Create a class named **Square** that extends **GeometricObject** *and* implements **Colorable**.
- Implement **howToColor()** to display a message on how to colour the square.
- Create an additional class to test the creation of a **Square** and its method **howToColor()**.

```
public abstract class GeometricObject {  
    // some methods and instance variables  
  
    public abstract double findArea();  
    public abstract double findPerimeter();  
}
```

# Interfaces (2/3)

- Answer the following questions:
  - Identify what is wrong with the **interface** below.

```
public interface SomethingIsWrong {  
    void aMethod(int aValue) {  
        System.out.println("Hi Mom");  
    }  
}
```

- Can an interface be given the **private** access modifier?

# Interfaces (3/3)

- Identify the statements below about **interfaces**, that are **TRUE**.
    - a. Interfaces do not allow for multiple inheritance at design level.
    - b. Interfaces can be extended by any number of other interfaces.
    - c. Interfaces can extend any number of other interfaces.
    - d. Members of an interface are never **static**.
    - e. Methods of an interface can always be declared **static**.
- 
- Identify the field declarations that are **legal** in the body of an **interface**.
    - a. `public static int answer = 10;`
    - b. `int answer;`
    - c. `final static int answer = 10;`
    - d. `public int answer = 10;`
    - e. `private final static int answer = 10;`

# Constructors

- Identify the constructors in class **SonOfBoo** that are not legal.

```
public class Boo {  
    public Boo(int i) { }      → (1)  
    public Boo(String s) { }  → (2)  
    public Boo(String s, int i) { }  (3)  
}
```

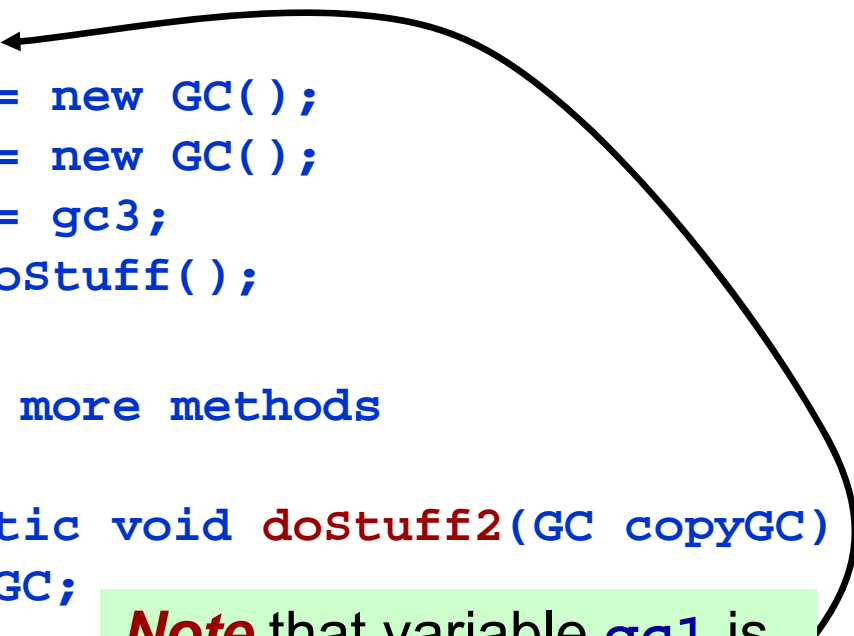

```
class SonOfBoo extends Boo {  
    public SonOfBoo() { super("boo"); }  
    public SonOfBoo(int i) { super("Fred"); }  
    public SonOfBoo(String s) { super(42); }  
    public SonOfBoo(String a, String b, String c) { super(a, b); }  
    public SonOfBoo(int i, int j) { super("man", j); }  
    public SonOfBoo(int i, int x, int y) { super(i, "star"); }  
}
```

# Garbage Collection

- Identify the lines of code that, if added to the program at point **X** would cause exactly one more object to be eligible for the **Garbage Collector**.

```
copyGC = null;
gc2 = null;
newGC = gc3;
gc1 = null;
newGC = null;
gc4 = null;
gc3 = gc2;
gc1 = gc4;
gc3 = null;
```

```
public class GC {
    public static GC doStuff() {
        GC newGC = new GC();
        doStuff2(newGC);
        return newGC;
    }
    public static void main(String[] args) {
        GC gc1;
        GC gc2 = new GC();
        GC gc3 = new GC();
        GC gc4 = gc3;
        gc1 = doStuff();
        X
        // call more methods
    }
    public static void doStuff2(GC copyGC) {
        GC localGC;
    }
}
```

**Note** that variable `gc1` is not initialised to a default value here, because it is a local variable.

# Constructor Chaining

- Determine the order in which the constructors execute in this example.

```
//Should be in C1.java
public class C1 {
    public C1() {
        System.out.println("1");
    }
}

//Should be in C2.java
public class C2 extends C1{
    public C2() {
        super();
        System.out.println("2");
    }
}

//Should be in C3.java
public class C3 extends C2 {
    public C3() {
        System.out.println("3");
    }

    public static void main(String args[]) {
        //Q: What list of numbers will be printed?
        // (What order are the constructors executed?)
        C3 obj = new C3();
    }
}
```

# static and instance methods

- What is wrong with the code below?

```
public class ExampleGoneWrong
{
    public int i = 0;
    public static int s = 0;
    public void doSomethingInstance() {
        System.out.println("Instance Method");
        System.out.println(i);
        System.out.println(s);
    }
    public static void doSomethingStatic() {
        System.out.println("Static Method");
        System.out.println(i);
        System.out.println(s);
    }
    public static void main(String args[]){
        doSomethingStatic();
        doSomethingInstance();
    }
}
```

# Stack and Heap Storage

- Which is on *stack* and which is on *heap*?

```
import java.awt.Rectangle;
public class SH {
    public int i = 0;
    public Rectangle r = new Rectangle(10,10);
}
```

```
public class SHTest {
    public static void main(String args[])
    {
        int i = 0;
        SH s = new SH();
    }
}
```

# Constructors & Protection

- Determine **what is wrong or missing** and **what is OK**, in the code below.

```
public class L2Super {  
    private String name;  
    private int num = 0;  
    public void setName(String aName) {  
        name = aName;  
    }  
    public void setNum(int num) {  
        num = num;  
    }  
    public L2Super(String aName) {  
        name = aName;  
    }  
    public int getNum() { return num; }  
    public String getName() { return name; }  
}
```

```
public class L2Sub extends L2Super {  
  
    public L2Sub() { }  
    public L2Sub(String aName){  
        super(aName);  
    }  
  
    public String getName() { return name; }  
  
    public static void main(String args[]){  
        L2Sub a = new L2Sub();  
        L2Sub b = new L2Sub("Tim");  
        System.out.println(b.name);  
        System.out.println(b.getName());  
  
        b.setNum(5);  
        System.out.println(b.getNum());  
    }  
}
```

# final variables and *pass-by-value*

- What is the output?

```
public class FinalPass {  
    final static int[] array1 = new int[] {0, 1};  
    final static int[] array2 = new int[] {1, 0};  
  
    public static void main(String[] args) {  
        System.out.println(array1);  
        System.out.println("A: " + array1[0] + ", " + array1[1]);  
  
        array1=array2;  
        System.out.println(array1);  
        System.out.println("B: " + array1[0] + ", " + array1[1]);  
  
        array1[0]++;  
        System.out.println(array1);  
        System.out.println("C: " + array1[0] + ", " + array1[1]);  
  
        array1[0] = array2[0];  
        array1[1] = array2[1];  
        System.out.println(array1);  
        System.out.println("D: " + array1[0] + ", " + array1[1]);  
  
        method1(array1);  
        System.out.println(array1);  
        System.out.println("F: " + array1[0] + ", " + array1[1]);  
    }  
  
    public static void method1(int[] array){  
        System.out.println(array);  
        System.out.println("E: " + array[0] + ", " + array[1]);  
        array[0] = 9;  
        array[1] = 9;  
    }  
}
```

# Strings (1/3)

- Consider the following string:

```
String hannah = "Did Hannah see bees? Hannah did.";
```

- What is the value displayed by the expression `hannah.length()`?
    - What is the value returned by the method call `hannah.charAt(12)`?
    - Write an expression that refers to the letter `b` in the `String` referred to by `hannah`.
- 
- Write a program that *computes your initials* from your full name and *displays them*.

# Strings (2/3)

- In the program below, what is the value of **result** after each *numbered line* executes?

```
public class ComputeResult {
    public static void main(String[] args) {
        String original = "software";
        StringBuilder result = new StringBuilder("hi");
        int index = original.indexOf('a');
/*1*/ result.setCharAt(0, original.charAt(0));
/*2*/ result.setCharAt(1, original.charAt(original.length()-1));
/*3*/ result.insert(1, original.charAt(4));
/*4*/ result.append(original.substring(1,4));
/*5*/ result.insert(3, (original.substring(index, index+2) + " "));
        System.out.println(result);
    }
}
```

# Strings (3/3)

- Which **two** statements are **TRUE**?
  - a. **String** objects are immutable.
  - b. Subclasses of the **String** class can be mutable.
  - c. All wrapper classes are declared **final**.
  - d. All objects have a **private** method named **toString()**.

- What is the output of the program below?

```
public class ExampleStrings {  
    public static void main(String[] args) {  
        String str1 = "ab" + "12";  
        String str2 = "ab" + 12;  
        String str3 = new String("ab12");  
        System.out.println((str1==str2) + " " + (str1==str3));  
    }  
}
```

# GUI (1/4)

- The following program is supposed to display a button in a frame, but **nothing is displayed**. What is the problem?

```
import javax.swing.*;

public class Test extends JFrame {
    public Test() {
        getContentPane().add(new JButton("OK"));
    }

    public static void main(String[] args) {
        JFrame frame = new JFrame();
        frame.setSize(100,200);
        frame.setVisible(true);
    }
}
```

# GUI (2/4)

- What happens when the code below is **run**? Will anything be **displayed**?

```
import java.awt.*;
import javax.swing.*;
public class Test extends JFrame {
    public Test() {
        JButton jbt1 = new JButton();
        JButton jbt2 = new JButton();
        JPanel p1 = new JPanel();
        p1.add(jbt1);
        JPanel p2 = new JPanel();
        p2.add(jbt2);
        JPanel p3 = new JPanel();
        p2.add(jbt1);
        getContentPane().add(p1, BorderLayout.NORTH);
        getContentPane().add(p2, BorderLayout.SOUTH);
        getContentPane().add(p3, BorderLayout.CENTER);
    }
}
```

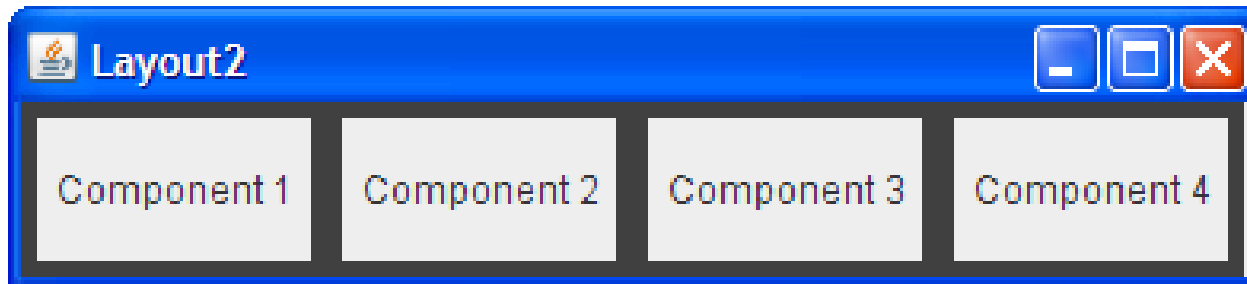

**(code cont.)**

```
public static void main(String[] args) {
    // Create a frame and set its properties.
    JFrame frame = new Test();
    frame.setTitle("ButtonIcons");
    frame.setSize(220,120);
    frame.setDefaultCloseOperation(
        JFrame.EXIT_ON_CLOSE);
    frame.setVisible(true);
}
```

# GUI (3/4)

- Choose the **layout manager(s)** most naturally suited for the following **layout description**, an example of which is given below: “the container has a row of components that should all be displayed at the same size, filling the container’s entire area”.
- a. `FlowLayout`
- b. `GridLayout`
- c. `BorderLayout`
- d. Options *a* and *b*.

**Note:** You can assume that the container controlled by the layout manager is a `JPanel`.

# GUI (4/4)

- The GUI below uses a **FlowLayout** manager to arrange the display of the 6 buttons.
  - Write the Java code that generates this GUI.
  - What would happen to the displayed GUI if it was resized into a bigger window?
